# Netbeans

Skeleton Tutorial

There are two ways to load the Skeleton into Netbeans: Drag And Drop or Manual Copy.
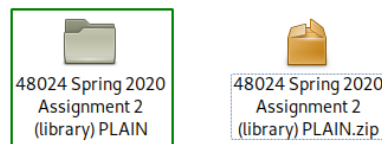

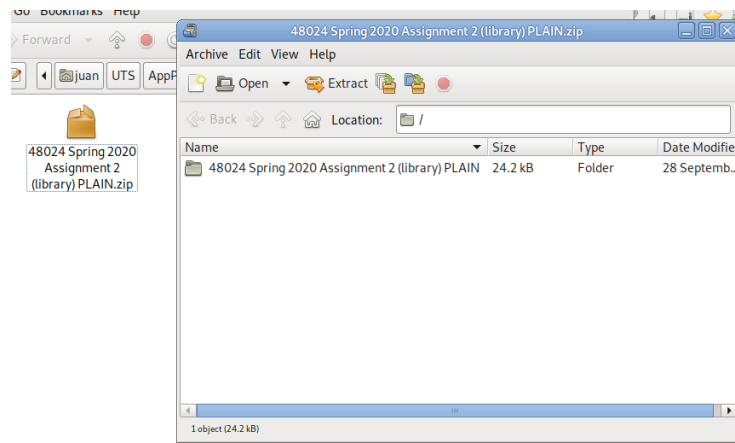

Drag And Drop

1. Create a new JavaFX application project in Netbeans:

2. Write down the Project Location path, and remember to deselect the "Create Application Class" option:
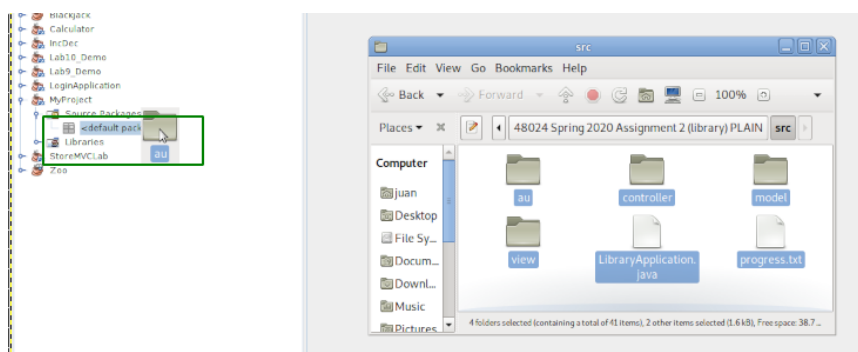

3. Download the skeleton file and unzip it (e.g. on your Desktop):

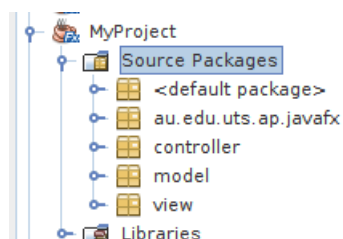

4. Browse the contents into the src directory:

5. Select all the contents and drag it to the <default package> in your project:

Now the project has the skeleton loaded:

Manual Copy

1. Follow the steps 1 to 4 from **Drag And Drop**.

2. Open your "NetbeansProjects" directory (from step 2 in Drag and Drop) and browse to "<projectName>/src"

3. Copy all the contents from Drag And Drop step 4 into your netbeans project src directory:

Now the project has the skeleton loaded
